Memory Game

This is the code for a web based memory game app. Users match the face down cards until all are matching.

Table of Contents

Gameplay

The user first opens up the app and the shuffled cards are already there. To open up a card just click on it. On the second card opened up, if it matches, they will change color then do an animation. If they don't match they turn red, shake, and flip back over. This is repeated until all of the cards are matched. At any point the user can restart the game. This restarts the timer, stars, and move counter aswell as reshuffles the deck.

Install

Download the zip file and extract its contents. Then open the memory.html file.

This will launch the game in the browser
